

## MSP430F676x1A Polyphase Metering SoCs

### 1 Device Overview

#### 1.1 Features

- Accuracy <0.5% Over 2000:1 Dynamic Range for Phase Current
- Meets or Exceeds ANSI C12.20 and IEC 63053 Standards
- Support for Multiple Sensors Such as Current Transformers, Rogowski Coils, or Shunts
- Power Measurement for up to Three Phases
- Four-Quadrant Measurement per Phase or Cumulative
- Exact Phase-Angle Measurements
- Digital Phase Correction for Current Transformers
- 40-Hz to 70-Hz Line Frequency Range Using Single Calibration
- Flexible Power Supply Options With Automatic Switching
- Display Operates at Very Low Power During AC Mains Failure: 3  $\mu$ A in LPM3
- Real-Time Clock (RTC) Module Operating from Dedicated Power Supply (AUXVCC3) Offering Integrated Offset and Temperature Calibration Features
- Multiple Communication Interfaces for Smart Meter Implementations
- High-Performance 25-MHz CPU With 32-Bit Multiplier
- Up to 128KB of Flash With Single-Cycle Execution
- Up to 8KB of RAM With Single-Cycle Access
- Up to Three Independent 24-Bit Sigma-Delta Analog-to-Digital Converters (ADCs) With Differential Inputs and Variable Gain
- System ADC:
  - 10-Bit 200-kSPS 6-Channel Plus Temperature Sensor and Supply Measurement
- Wide Input Supply-Voltage Range:
  - 1.8 V to 3.6 V
- Ultra-Low Power Consumption During Energy Measurement
  - 3.0 mW at 10-MHz Operation (3.0 V)
- Multiple Low-Power Modes
  - Standby Mode (LPM3): 2.5  $\mu$ A at 3 V, Wake up in 3  $\mu$ s (Typical)
  - RTC Mode (LPM3.5): 1.24  $\mu$ A at 3 V (Typical)
  - Shutdown Mode (LPM4.5): 0.78  $\mu$ A at 3 V (Typical)
- LCD Driver With Contrast Control for up to 320 Segments
- Password-Protected RTC With Crystal Offset Calibration and Temperature Compensation
- Four Communications Ports
  - Configurable Among Four UART, Three SPI, and One I<sup>2</sup>C Interfaces
- Four 16-Bit Timers With Nine Capture/Compare Registers
- 100-Pin LQFP (PZ) Package With 72 I/O Pins
- 80-Pin LQFP (PN) Package With 52 I/O Pins
- Industrial Temperature Range of –40°C to 85°C
- Development Tool (Also See [Tools and Software](#))
  - [Polyphase Electric Meter with MSP430F67641 SoC \(EVM430-F67641\)](#)

#### 1.2 Applications

- Three-Phase Electronic Watt-Hour Meters
- Utility Metering
- Energy Monitoring

### 1.3 Description

The TI MSP430F676x1A polyphase metering SoCs are powerful highly integrated solutions for revenue meters that offer accuracy and low system cost with few external components. The MSP430F676x1A uses the low-power MSP430™ CPU with a 32-bit multiplier to perform all energy calculations, metering applications such as tariff rate management, and communications with AMR or AMI modules.

The MSP430F676x1A features TI's 24-bit sigma-delta converter technology, which provides better than 0.5% accuracy. Family members include up to 128KB of flash and 8KB of RAM and an LCD controller with support for up to 320 segments. The ultra-low-power nature of the MSP430F676x1A means that the system power supply can be minimized to reduce overall cost. Lowest standby power means that backup energy storage can be minimized, and critical data retained longer in case of a mains power failure.

The MSP430F676x1A family executes the TI energy measurement software library, which calculates all relevant energy and power results. The energy measurement software library is available with the MSP430F676x1A at no cost. Industry-standard development tools and hardware platforms are available to speed development of meters that meet all of the ANSI and IEC standards globally.

For complete module descriptions, see the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

## 2 Revision History

Changes from February 25, 2015 to October 3, 2018	Page
• Added link to development tool in <a href="#">Section 1.1, Features</a> .....	<a href="#">1</a>
• Added <a href="#">Section 3.1, Related Products</a> .....	<a href="#">6</a>
• Added <a href="#">Section 4.5, Buffer Type</a> .....	<a href="#">31</a>
• Added typical conditions statements at the beginning of <a href="#">Section 5, Specifications</a> .....	<a href="#">32</a>
• Added SD24_B input pins and AUXVCCx pins to exception list on "Voltage applied to pins" parameter, and added SD24_B input pin limits in "Diode current at pins" parameter in <a href="#">Section 5.1, Absolute Maximum Ratings</a> .....	<a href="#">32</a>
• Added <a href="#">Section 5.7, Thermal Resistance Characteristics</a> .....	<a href="#">37</a>
• Corrected the type of nonvolatile memory (changed "FRAM" to "flash") in <a href="#">Section 5.8.1, Power Supply Sequencing</a> .....	<a href="#">38</a>
• Updated notes (1) and (2) and added note (3) in <a href="#">Table 5-1, Wake-up Times From Low-Power Modes and Reset</a> ..	<a href="#">38</a>
• Changed the MIN value of the $V_{(DVCC\_BOR\_hys)}$ parameter from 60 mV to 50 mV in <a href="#">Table 5-12, PMM, Brownout Reset (BOR)</a> .....	<a href="#">48</a>
• Replaced $f_{Frame}$ parameter with $f_{LCD}$ , $f_{FRAME,4mux}$ , and $f_{FRAME,8mux}$ parameters in <a href="#">Table 5-33, LCD_C Operating Conditions</a> .....	<a href="#">60</a>
• Removed ADC10DIV from the formula for the TYP value in the second row for $t_{CONVERT}$ in <a href="#">Table 5-44, 10-Bit ADC, Timing Parameters</a> , because $f_{ADC10CLK}$ is after division .....	<a href="#">69</a>
• Updated Test Conditions for all parameters in <a href="#">Table 5-45, 10-Bit ADC, Linearity Parameters</a> : changed from " $(V_{eREF+} - V_{eREF-})_{min} \leq (V_{eREF+} - V_{eREF-})$ " to " $1.4 V \leq (V_{eREF+} - V_{eREF-})$ " in all cases.....	<a href="#">70</a>
• Added " $C_{VeREF+} = 20 pF$ " to $E_I$ Test Conditions.....	<a href="#">70</a>
• Changed all instances of "bootloader" to "bootloader" throughout document.....	<a href="#">79</a>
• Corrected spelling of NMIIFG in <a href="#">Table 6-9, System Module Interrupt Vector Registers</a> .....	<a href="#">85</a>
• Replaced former section <i>Development Tools Support</i> with <a href="#">Section 8.3, Tools and Software</a> .....	<a href="#">145</a>
• Changed the format in and added content to <a href="#">Section 8.4, Documentation Support</a> .....	<a href="#">146</a>

### 3 Device Comparison

(1) For the most current package and ordering information, see the *Package Option Addendum* in [Section 9](#), or see the TI website at [www.ti.com](http://www.ti.com).

(2) Package drawings, thermal data, and symbolization are available at [www.ti.com/packaging](http://www.ti.com/packaging).

(3) Each number in the sequence represents an instantiation of Timer\_A with its associated number of capture compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer\_A, the first instantiation having 3 and the second instantiation having 5 capture compare registers and PWM output generators, respectively.

Figure 4-2 shows the pinout for the 80-pin PN package.

NOTE: The secondary digital functions on Ports P1, P2, and P3 are fully mappable. This pinout shows the default mapping. See Section 6.12.6 for details.

NOTE: The pins VDSYS and DVSYS must be connected externally on the board for proper device operation.

CAUTION: The LDCAP/R33 pin must be connected to DVSS if not used.

- (1) For each multiplexed pin, the signal that is listed first in this table is the reset default.  
 (2) To determine the pin mux encodings for each pin, refer to Section 6.13, *Input/Output Schematics*.  
 (3) Signal Types: I = Input, O = Output, I/O = Input or Output  
 (4) Buffer Types: LVC MOS, Analog, or Power (see Table 4-5, *Buffer Type*)  
 (5) Reset States:  
 OFF = High-impedance input with pullup or pulldown disabled (if available)  
 PU = High-impedance input with pullup enabled  
 N/A = Not applicable

- (1) For each multiplexed pin, the signal that is listed first in this table is the reset default.  
(2) To determine the pin mux encodings for each pin, refer to Section 6.13, *Input/Output Schematics*.  
(3) Signal Types: I = Input, O = Output, I/O = Input or Output  
(4) Buffer Types: LVC MOS, Analog, or Power (see Table 4-5, *Buffer Type*)  
(5) Reset States:  
OFF = High-impedance input with pullup or pulldown disabled (if available)  
PU = High-impedance input with pullup enabled  
N/A = Not applicable

#### 4.4 Pin Multiplexing

Pin multiplexing for these devices is controlled by both register settings and operating modes (for example, if the device is in test mode). For details of the settings for each pin and schematics of the multiplexed ports, see [Section 6.13](#).

#### 4.5 Buffer Type

[Table 4-5](#) defines the buffer types that are referenced in [Table 4-1](#) and [Table 4-2](#).

**Table 4-5. Buffer Type**

BUFFER TYPE (STANDARD)	NOMINAL VOLTAGE	HYSTERESIS	PU OR PD	NOMINAL PU OR PD STRENGTH ( $\mu$ A)	OUTPUT DRIVE STRENGTH (mA)	OTHER CHARACTERISTICS
Analog	3.0 V	N	N/A	N/A	N/A	See analog modules in <a href="#">Section 5, Specifications</a> , for details
LVC MOS	3.0 V	Y	Programmable	See <a href="#">Section 5.8.4 Digital I/O Ports</a>	See <a href="#">Section 5.8.4 Digital I/O Ports</a>	
Power	3.0 V	Y with SVS on	N/A	N/A	N/A	

#### 4.6 Connection of Unused Pins

[Table 4-6](#) lists the correct termination of unused pins.

**Table 4-6. Connection of Unused Pins<sup>(1)</sup>**

PIN	POTENTIAL	COMMENT
AVCC	DV <sub>CC</sub>	
AVSS	DV <sub>SS</sub>	
LCDCAP	DV <sub>SS</sub>	
PJ.0/TDO PJ.1/TDI PJ.2/TMS PJ.3/TCK	Open	The JTAG pins are shared with general purpose I/O function (PJ.x). If not being used, these should be switched to port function, output direction (PJDIR.n = 1). When used as JTAG pins, these pins should remain open.
Px.y	Open	Switched to port function, output direction (PxDIR.n = 1). Px.y represents port x and bit y of port x (for example, P1.0, P1.1, P2.2, PJ.0, PJ.1)
RST/NMI	DV <sub>CC</sub> or V <sub>CC</sub>	47-k $\Omega$ pullup or internal pullup selected with 10-nF (2.2-nF) pulldown <sup>(2)</sup>
TEST	Open	This pin always has an internal pulldown enabled.
XIN	DV <sub>SS</sub>	For dedicated XIN pins only. XIN pins with shared GPIO functions should be programmed to GPIO and follow Px.y recommendations.
XOUT	Open	For dedicated XOUT pins only. XOUT pins with shared GPIO functions should be programmed to GPIO and follow Px.y recommendations.

- (1) Any unused pin with a secondary function that is shared with general purpose I/O should follow the Px.y unused pin connection guidelines.
- (2) The pulldown capacitor should not exceed 2.2 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools such as FET interfaces or GANG programmers.

## 5 Specifications

All graphs in this section are for typical conditions, unless otherwise noted.

Typical (TYP) values are specified at  $V_{CC} = 3.3\text{ V}$  and  $T_A = 25^\circ\text{C}$ , unless otherwise noted.

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages referenced to  $V_{SS} = V_{DVSS} = V_{AVSS}$ .
- (3) V<sub>CORE</sub> is for internal device use only. No external DC loading or voltage should be applied.
- (4) See [Table 5-35](#) for SD24\_B specifications.
- (5) See [Table 5-18](#) for AUX specifications.
- (6) A protection diode is connected to  $V_{CC}$  for the SD24\_B input pins. No protection diode is connected to  $V_{SS}$ .
- (7) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

### 5.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	$\pm 1000$	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	$\pm 250$	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as  $\pm 1000\text{ V}$  may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as  $\pm 250\text{ V}$  may actually have higher performance.

C <sub>DVCC</sub> / C <sub>VCORE</sub>	Capacitor ratio of DVCC to V <sub>CORE</sub>	10				

- (1) TI recommends powering AVCC and DVCC from the same source. A maximum difference of 0.3 V between V(AVCC) and V(DVCC) can be tolerated during power up and operation.
- (2) The minimum supply voltage is defined by the supervisor SVS levels when it is enabled. See the [Table 5-14](#) threshold parameters for the exact values and further details.
- (3) A capacitor tolerance of  $\pm 20\%$  or better is required.

I <sub>LOAD, AUX1D</sub>	Maximum load current that can be drawn from AUXVCC1 for core and IO (I <sub>LOAD</sub> = I <sub>CORE</sub> + I <sub>IO</sub> )			20	mA	
I <sub>LOAD, AUX2D</sub>	Maximum load current that can be drawn from AUXVCC2 for core and IO (I <sub>LOAD</sub> = I <sub>CORE</sub> + I <sub>IO</sub> )			20	mA	
I <sub>LOAD, AVCCA</sub>	Maximum load current that can be drawn from AVCC for analog modules (I <sub>LOAD</sub> = I <sub>Modules</sub> )			10	mA	
I <sub>LOAD, AUX1A</sub>	Maximum load current that can be drawn from AUXVCC1 for analog modules (I <sub>LOAD</sub> = I <sub>Modules</sub> )			5	mA	
I <sub>LOAD, AUX2A</sub>	Maximum load current that can be drawn from AUXVCC2 for analog modules (I <sub>LOAD</sub> = I <sub>Modules</sub> )			5	mA	

- (4) The MSP430 CPU is clocked directly with MCLK. Both the high and low phase of MCLK must not exceed the pulse width of the specified maximum frequency.
- (5) Modules may have a different maximum input clock specification. Refer to the specification of the respective module in this data sheet.

The numbers within the fields denote the supported PMMCOREVx settings.

## 5.8 Timing and Switching Characteristics

### 5.8.1 Power Supply Sequencing

TI recommends powering AVCC and DVCC pins from the same source. At a minimum, during power up, power down, and device operation, the voltage difference between AVCC and DVCC must not exceed the limits specified in [Absolute Maximum Ratings](#). Exceeding the specified limits may cause malfunction of the device including erroneous writes to RAM and flash.

### 5.8.2 Reset Timing

[Table 5-1](#) lists the device wake-up times.

**Table 5-1. Wake-up Times From Low-Power Modes and Reset**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
$t_{\text{WAKE-UP-FAST}}$	Wake-up time from LPM2, LPM3, or LPM4 to active mode <sup>(1)</sup>	PMMCOREV = SVSMLRRL = n (where n = 0, 1, 2, or 3), SVSLFP = 1	$f_{\text{MCLK}} \geq 4 \text{ MHz}$		3	5	$\mu\text{s}$
			$1 \text{ MHz} < f_{\text{MCLK}} < 4 \text{ MHz}$		4	6	
$t_{\text{WAKE-UP-SLOW}}$	Wake-up time from LPM2, LPM3, or LPM4 to active mode <sup>(2)(3)</sup>	PMMCOREV = SVSMLRRL = n (where n = 0, 1, 2, or 3), SVSLFP = 0			150	160	$\mu\text{s}$
$t_{\text{WAKE-UP-LPM4.5}}$	Wake-up time from LPM4.5 to active mode <sup>(4)</sup>				2	3	ms
$t_{\text{WAKE-UP-RESET}}$	Wake-up time from $\overline{\text{RST}}$ or BOR event to active mode <sup>(4)</sup>				2	3	ms

- (1) This value represents the time from the wake-up event to the first active edge of MCLK. The wake-up time depends on the performance mode of the low-side supervisor (SVSL) and low-side monitor (SVM<sub>L</sub>).  $t_{\text{WAKE-UP-FAST}}$  is possible with SVSL and SVM<sub>L</sub> in full performance mode or disabled. For specific register settings, see the *Low-Side SVS and SVM Control and Performance Mode Selection* section in the *Power Management Module and Supply Voltage Supervisor* chapter of the [MSP430x5xx and MSP430x6xx Family User's Guide](#).
- (2) This value represents the time from the wake-up event to the first active edge of MCLK. The wake-up time depends on the performance mode of the low-side supervisor (SVSL) and low-side monitor (SVM<sub>L</sub>).  $t_{\text{WAKE-UP-SLOW}}$  is set with SVSL and SVM<sub>L</sub> in normal mode (low current mode). For specific register settings, see the *Low-Side SVS and SVM Control and Performance Mode Selection* section in the *Power Management Module and Supply Voltage Supervisor* chapter of the [MSP430x5xx and MSP430x6xx Family User's Guide](#).
- (3) The wake-up times from LPM0 and LPM1 to AM are not specified. They are proportional to MCLK cycle time but are not affected by the performance mode settings as for LPM2, LPM3, and LPM4.
- (4) This value represents the time from the wake-up event to the reset vector execution.

- To improve EMI on the XT1 oscillator, the following guidelines should be observed.
  - Keep the trace between the device and the crystal as short as possible.
  - Design a good ground plane around the oscillator pins.
  - Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
  - Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
  - Use assembly materials and processes that avoid any parasitic load on the oscillator XIN and XOUT pins.
  - If conformal coating is used, ensure that it does not induce capacitive or resistive leakage between the oscillator pins.
- When XT1BYPASS is set, XT1 circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-Trigger Inputs section of this data sheet.
- Maximum frequency of operation of the entire device cannot be exceeded.
- Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the XT1DRIVE<sub>x</sub> settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:
  - For XT1DRIVE<sub>x</sub> = 0, C<sub>L,eff</sub> ≤ 6 pF
  - For XT1DRIVE<sub>x</sub> = 1, 6 pF ≤ C<sub>L,eff</sub> ≤ 9 pF
  - For XT1DRIVE<sub>x</sub> = 2, 6 pF ≤ C<sub>L,eff</sub> ≤ 10 pF
  - For XT1DRIVE<sub>x</sub> = 3, C<sub>L,eff</sub> ≥ 6 pF
- Includes parasitic bond and package capacitance (approximately 2 pF per pin). Because the PCB adds additional capacitance, TI recommends verifying the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.
- Requires external capacitors at both terminals. Values are specified by crystal manufacturers.
- Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies in between might set the flag.
- Measured with logic-level input frequency but also applies to operation with crystals.

- (1) When selecting the proper DCO frequency range (DCORSELx), the target DCO frequency,  $f_{DCO}$ , should be set to reside within the range of  $f_{DCO(n,0),MAX} \leq f_{DCO} \leq f_{DCO(n,31),MIN}$ , where  $f_{DCO(n,0),MAX}$  represents the maximum frequency specified for the DCO frequency, range n, tap 0 (DCOx = 0) and  $f_{DCO(n,31),MIN}$  represents the minimum frequency specified for the DCO frequency, range n, tap 31 (DCOx = 31). This ensures that the target DCO frequency resides within the range selected. It should also be noted that if the actual  $f_{DCO}$  frequency for the selected range causes the FLL or the application to select tap 0 or 31, the DCO fault flag is set to report that the selected range is at its minimum or maximum tap setting.

## 5.8.4 Digital I/O Ports

Table 5-6 lists the characteristics of the GPIOs.

**Table 5-6. Schmitt-Trigger Inputs, General-Purpose I/O**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V <sub>CC</sub>	MIN	TYP	MAX	UNIT
V <sub>IT+</sub>	Positive-going input threshold voltage		1.8 V	0.80		1.40	V
			3 V	1.50		2.10	
V <sub>IT-</sub>	Negative-going input threshold voltage		1.8 V	0.45		1.00	V
			3 V	0.75		1.65	
V <sub>hys</sub>	Input voltage hysteresis (V <sub>IT+</sub> – V <sub>IT-</sub> )		1.8 V	0.3		0.85	V
			3 V	0.4		1.0	
R <sub>Pull</sub>	Pullup or pulldown resistor <sup>(1)</sup>	For pullup: V <sub>IN</sub> = V <sub>SS</sub> For pulldown: V <sub>IN</sub> = V <sub>CC</sub>		20	35	50	kΩ
C <sub>I</sub>	Input capacitance	V <sub>IN</sub> = V <sub>SS</sub> or V <sub>CC</sub>			5		pF

(1) Also applies to  $\overline{\text{RST}}$  pin when pullup or pulldown resistor is enabled.

Table 5-7 lists the characteristics of the P1 and P2 inputs.

**Table 5-7. Inputs, Ports P1 and P2<sup>(1)</sup>**

		I <sub>(OLmax)</sub> = 15 mA <sup>(3)</sup>		V <sub>SS</sub>	V <sub>SS</sub> + 0.60	

- (1) The maximum total current, I<sub>(OHmax)</sub>, for all outputs combined should not exceed ±20 mA to hold the maximum voltage drop specified. See Section 5.3 for more details.
- (2) The maximum total current, I<sub>(OLmax)</sub>, for all outputs combined should not exceed ±48 mA to hold the maximum voltage drop specified.
- (3) The maximum total current, I<sub>(OLmax)</sub>, for all outputs combined should not exceed ±100 mA to hold the maximum voltage drop specified.

5.8.4.1 Typical Characteristics, General-Purpose I/O (Full Drive Strength)

Table 5-10 lists the output characteristics of the GPIOs in reduced drive strength mode. Also see Figure 5-7 through Figure 5-10.

**Table 5-10. Outputs, General-Purpose I/O (Reduced Drive Strength)**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)<sup>(1)</sup>

PARAMETER		TEST CONDITIONS	V <sub>CC</sub>	MIN	MAX	UNIT

		I <sub>(OLmax)</sub> = 6 mA <sup>(4)</sup>		V <sub>SS</sub>	V <sub>SS</sub> + 0.60	

(1) Selecting reduced drive strength may reduce EMI.

(2) The maximum total current, I<sub>(OHmax)</sub>, for all outputs combined should not exceed ±20 mA to hold the maximum voltage drop specified. See Section 5.3 for more details.

(3) The maximum total current, I<sub>(OLmax)</sub>, for all outputs combined, should not exceed ±48 mA to hold the maximum voltage drop specified.

(4) The maximum total current, I<sub>(OLmax)</sub>, for all outputs combined, should not exceed ±100 mA to hold the maximum voltage drop specified.

5.8.4.2 Typical Characteristics, General-Purpose I/O (Reduced Drive Strength)

Table 5-11 lists the output frequencies of the GPIOs.

**Table 5-11. Output Frequency, General-Purpose I/O**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	MAX	UNIT
f <sub>Px,y</sub>	Port output frequency (with load)	See <sup>(1)</sup> <sup>(2)</sup>	V <sub>CC</sub> = 1.8 V, PMMCOREV <sub>x</sub> = 0		16	MHz

### 5.8.10 SD24\_B Module

Table 5-35 lists the power supply and recommended operating conditions of the SD24\_B.

**Table 5-35. SD24\_B Power Supply and Recommended Operating Conditions**

			MIN	TYP	MAX	UNIT
$V_{CC}$	Analog supply voltage	$V_{CC} = DV_{CC}$ , $V_{SS} = DV_{SS} = 0\text{ V}$	2.4		3.6	V
$f_{SD}$	Modulator clock frequency <sup>(1)</sup>		0.03		2.3	MHz
$V_I$	Absolute input voltage range		$V_{SS} - 1$		$V_{CC}$	V
$V_{IC}$	Common-mode input voltage range		$V_{SS} - 1$		$V_{CC}$	V
$V_{ID,FS}$	Differential full-scale input voltage	$V_{ID} = V_{I,A+} - V_{I,A-}$	$-V_{REF}/GAIN$		$+V_{REF}/GAIN$	
$V_{ID}$	Differential input voltage for specified performance <sup>(2)</sup>	SD24REFS = 1	SD24GAINx = 1	±910	±920	mV
			SD24GAINx = 2	±455	±460	
			SD24GAINx = 4	±227	±230	
			SD24GAINx = 8	±113	±115	
			SD24GAINx = 16	±57	±58	
			SD24GAINx = 32	±28	±29	
			SD24GAINx = 64	±14	±14.5	
$C_{REF}$	VREF load capacitance <sup>(3)</sup>	SD24REFS = 1		100		nF

(1) Modulator clock frequency: MIN = 32.768 kHz – 10% ≈ 30 kHz. MAX = 32.768 kHz × 64 + 10% ≈ 2.3 MHz

(2) The full-scale range (FSR) is defined by  $V_{FS+} = +V_{REF}/GAIN$  and  $V_{FS-} = -V_{REF}/GAIN$ :  $FSR = V_{FS+} - V_{FS-} = 2 \times V_{REF} / GAIN$ . If  $V_{REF}$  is sourced externally, the analog input range should not exceed 80% of  $V_{FS+}$  or  $V_{FS-}$ ; that is,  $V_{ID} = 0.8 V_{FS-}$  to  $0.8 V_{FS+}$ . If  $V_{REF}$  is sourced internally, the given  $V_{ID}$  ranges apply.

(3) There is no capacitance required on VREF. However, a capacitance of 100 nF is recommended to reduce any reference voltage noise.

(1) The gain error E<sub>G</sub> specifies the deviation of the actual gain G<sub>act</sub> from the nominal gain G<sub>nom</sub>:  $E_G = (G_{act} - G_{nom})/G_{nom}$ . It covers process, temperature and supply voltage variations.

(2) The gain error temperature coefficient ΔE<sub>G</sub> / ΔT specifies the variation of the gain error E<sub>G</sub> over temperature ( $E_G(T) = (G_{act}(T) - G_{nom})/G_{nom}$ ) using the box method (that is, MIN and MAX values):

$$\Delta E_G / \Delta T = (\text{MAX}(E_G(T)) - \text{MIN}(E_G(T))) / (\text{MAX}(T) - \text{MIN}(T)) = (\text{MAX}(G_{act}(T)) - \text{MIN}(G_{act}(T))) / G_{nom} / (\text{MAX}(T) - \text{MIN}(T))$$

with T ranging from -40°C to +85°C.

(3) The gain error vs V<sub>CC</sub> coefficient ΔE<sub>G</sub> / ΔV<sub>CC</sub> specifies the variation of the gain error E<sub>G</sub> over supply voltage ( $E_G(V_{CC}) = (G_{act}(V_{CC}) - G_{nom})/G_{nom}$ ) using the box method (that is, MIN and MAX values):

$$\Delta E_G / \Delta V_{CC} = (\text{MAX}(E_G(V_{CC})) - \text{MIN}(E_G(V_{CC}))) / (\text{MAX}(V_{CC}) - \text{MIN}(V_{CC})) = (\text{MAX}(G_{act}(V_{CC})) - \text{MIN}(G_{act}(V_{CC}))) / G_{nom} / (\text{MAX}(V_{CC}) - \text{MIN}(V_{CC}))$$

with V<sub>CC</sub> ranging from 2.4 V to 3.6 V.

(4) The offset error E<sub>OS</sub> is measured with shorted inputs in 2s-complement mode with +100% FS = V<sub>REF</sub> / G and -100% FS = -V<sub>REF</sub> / G. Conversion between E<sub>OS</sub> [FS] and E<sub>OS</sub> [V] is as follows: E<sub>OS</sub> [FS] = E<sub>OS</sub> [V] × G / V<sub>REF</sub>; E<sub>OS</sub> [V] = E<sub>OS</sub> [FS] × V<sub>REF</sub> / G.

(5) The offset error temperature coefficient ΔE<sub>OS</sub> / ΔT specifies the variation of the offset error E<sub>OS</sub> over temperature using the box method (that is, MIN and MAX values):

$$\Delta E_{OS} / \Delta T = (\text{MAX}(E_{OS}(T)) - \text{MIN}(E_{OS}(T))) / (\text{MAX}(T) - \text{MIN}(T))$$

with T ranging from -40°C to +85°C.

(6) The offset error vs V<sub>CC</sub> ΔE<sub>OS</sub> / ΔV<sub>CC</sub> specifies the variation of the offset error E<sub>OS</sub> over supply voltage using the box method (that is, MIN and MAX values):

$$\Delta E_{OS} / \Delta V_{CC} = (\text{MAX}(E_{OS}(V_{CC})) - \text{MIN}(E_{OS}(V_{CC}))) / (\text{MAX}(V_{CC}) - \text{MIN}(V_{CC}))$$

with V<sub>CC</sub> ranging from 2.4 V to 3.6 V.

(7) The DC CMRR specifies the change in the measured differential input voltage value when the common-mode voltage varies:  $\text{DC CMRR} = -20 \log(\Delta_{MAX}/\text{FSR})$  with Δ<sub>MAX</sub> being the difference between the minimum value and the maximum value measured when sweeping the common-mode voltage (for example, calculating with 16-bit FSR = 65536, a maximum change by 1 LSB results in  $-20 \log(1/65536) \approx -96 \text{ dB}$ ).

The DC CMRR is measured with both inputs connected to the common-mode voltage (that is, no differential input signal is applied), and the common-mode voltage is swept from -1 V to V<sub>CC</sub>.

- (8) The AC CMRR is the difference between a hypothetical signal with the amplitude and frequency of the applied common-mode ripple applied to the inputs of the ADC and the actual common-mode signal spur visible in the FFT spectrum:  
 $AC \text{ CMRR} = \text{Error Spur [dBFS]} - 20\log(V_{CM} / 1.2 \text{ V} / G) \text{ [dBFS]}$  with a common-mode signal of  $V_{CM} \times \sin(2\pi \times f_{CM} \times t)$  applied to the analog inputs.  
 The AC CMRR is measured with the both inputs connected to the common-mode signal (that is, no differential input signal is applied).  
 With the specified typical values the error spur is within the noise floor (as specified by the SINAD values).
- (9) The AC PSRR is the difference between a hypothetical signal with the amplitude and frequency of the applied supply voltage ripple applied to the inputs of the ADC and the actual supply ripple spur visible in the FFT spectrum:  
 $AC \text{ PSRR} = \text{Error Spur [dBFS]} - 20\log(50 \text{ mV} / 1.2 \text{ V} / G) \text{ [dBFS]}$  with a signal of  $50 \text{ mV} \times \sin(2\pi \times f_{VCC} \times t)$  added to  $V_{CC}$ .  
 The AC PSRR is measured with the inputs grounded (that is, no analog input signal is applied).  
 With the specified typical values the error spur is within the noise floor (as specified by the SINAD values).  
 SD24GAIN: 1 → Hypothetical signal:  $20\log(50 \text{ mV} / 1.2 \text{ V} / 1) = -27.6 \text{ dBFS}$   
 SD24GAIN: 8 → Hypothetical signal:  $20\log(50 \text{ mV} / 1.2 \text{ V} / 8) = -9.5 \text{ dBFS}$   
 SD24GAIN: 32 → Hypothetical signal:  $20\log(50 \text{ mV} / 1.2 \text{ V} / 32) = 2.5 \text{ dBFS}$
- (10) The crosstalk (XT) is specified as the tone level of the signal applied to the crosstalk source seen in the spectrum of the converter under test. It is measured with the inputs of the converter under test being grounded.

(1) The analog input voltage range must be within the selected reference voltage range V<sub>R+</sub> to V<sub>R-</sub> for valid conversion results. The external reference voltage requires decoupling capacitors. Two decoupling capacitors, 10 μF and 100 nF, should be connected to VREF to decouple the dynamic current required for an external reference source if it is used for the ADC10\_A. - (1) The external reference is used during ADC conversion to charge and discharge the capacitance array. The input capacitance, C<sub>i</sub>, is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 10-bit accuracy.
- (2) The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
- (3) The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.
- (4) The accuracy limits the minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.
- (5) Two decoupling capacitors, 10 μF and 100 nF, should be connected to VeREF to decouple the dynamic current required for an external reference source if it is used for the ADC10\_A. Also see the [MSP430x5xx and MSP430x6xx Family User's Guide](#).

## 5.8.12 REF Module

Table 5-47 lists the characteristics of the built-in reference.

**Table 5-47. REF, Built-In Reference**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V <sub>CC</sub>	MIN	TYP	MAX	UNIT

t <sub>ON</sub>	SD24_B internal reference turnon time <sup>(7)</sup>	SD24REFS = 0 → 1, C <sub>REF</sub> = 100 nF	3 V		200		μs

(1) The internal reference current is supplied by terminal AV<sub>CC</sub>. Consumption is independent of the ADC10ON control bit, unless a conversion is active. The REFON bit enables to settle the built-in reference before starting an A/D conversion.

(2) Calculated using the box method: (MAX(−40°C to 85°C) – MIN(−40°C to 85°C)) / MIN(−40°C to 85°C)/(85°C – (−40°C)).

(3) The temperature sensor offset can be significant. TI recommends a single-point calibration to minimize the offset error of the built-in temperature sensor.

(4) The typical equivalent impedance of the sensor is 51 kΩ. The sample time required includes the sensor-on time t<sub>SENSOR(on)</sub>.

(5) The on-time t<sub>VMID(on)</sub> is included in the sampling time t<sub>VMID(sample)</sub>; no additional on time is needed.

(6) The condition is that the error in a conversion started after t<sub>REFON</sub> is ≤ 1 LSB.

(7) The condition is that SD24\_B conversion started after t<sub>ON</sub> should ensure specified SINAD values for the selected Gain, OSR, and f<sub>SD24</sub>.

### 5.8.13 Flash

Table 5-48 lists the characteristics of the flash memory.

f <sub>MCLK,MGR</sub>	MCLK frequency in marginal read mode (FCTL4.MGR0 = 1 or FCTL4.MGR1 = 1)		0		1	MHz

(1) The cumulative program time must not be exceeded when writing to a 128-byte flash block. This parameter applies to all programming modes: individual word or byte write and block write.

(2) These values are hardwired into the state machine of the flash controller.

### 5.8.14 Emulation and Debug

Table 5-49 lists the characteristics of the JTAG and Spy-Bi-Wire interface.

**Table 5-49. JTAG and Spy-Bi-Wire Interface**

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		V <sub>CC</sub>	MIN	TYP	MAX	UNIT

f <sub>TCK</sub>	TCK input frequency for 4-wire JTAG <sup>(2)</sup>	2.2 V	0		5	MHz
		3 V	0		10	
R <sub>internal</sub>	Internal pulldown resistance on TEST	2.2 V, 3 V	45	60	80	kΩ

(1) Tools that access the Spy-Bi-Wire interface must wait for the minimum t<sub>SBW,En</sub> time after pulling the TEST/SBWTCK pin high before applying the first SBWTCK clock edge.

(2) f<sub>TCK</sub> may be restricted to meet the timing requirements of the module selected.

## 6 Detailed Description

### 6.1 Overview

The TI MSP430F676x1A polyphase metering SoCs are powerful highly integrated solutions for revenue meters that offer accuracy and low system cost with few external components. The F676x1A uses the low-power MSP430™ CPU with a 32-bit multiplier to perform all energy calculations, metering applications such as tariff rate management, and communications with AMR or AMI modules. The F676x1A features TI's 24-bit sigma-delta converter technology, which provides better than 0.5% accuracy. Family members include up to 128KB of flash and 8KB of RAM and an LCD controller with support for up to 320 segments.

### 6.3 CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock. Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers (see [Figure 6-3](#)).

Peripherals are connected to the CPU using data, address, and control buses. Peripherals can be managed with all instructions.

## 6.4 Instruction Set

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data. [Table 6-1](#) lists examples of the three types of instruction formats. [Table 6-2](#) lists the address modes.

**Table 6-1. Instruction Word Formats**

INSTRUCTION WORD FORMAT	EXAMPLE	OPERATION
Dual operands, source and destination	ADD R4,R5	$R4 + R5 \rightarrow R5$
Single operands, destination only	CALL R8	$PC \rightarrow (TOS), R8 \rightarrow PC$
Relative jump, un/conditional	JNE	Jump-on-equal bit = 0

## 6.5 Operating Modes

These microcontrollers have one active mode and seven software-selectable low-power modes of operation. An interrupt event can wake up the device from any of the low-power modes, service the request, and restore back to the low-power mode on return from the interrupt program.

Software can configure the following operating modes:

- Active mode (AM)
  - All clocks are active
- Low-power mode 0 (LPM0)
  - CPU is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
  - FLL loop control remains active
- Low-power mode 1 (LPM1)
  - CPU is disabled
  - FLL loop control is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
- Low-power mode 2 (LPM2)
  - CPU is disabled
  - MCLK and FLL loop control and DCOCLK are disabled
  - DC generator of the DCO remains enabled
  - ACLK remains active
- Low-power mode 3 (LPM3)
  - CPU is disabled
  - MCLK, FLL loop control, and DCOCLK are disabled
  - DC generator of the DCO is disabled
  - ACLK remains active
- Low-power mode 4 (LPM4)
  - CPU is disabled
  - ACLK is disabled
  - MCLK, FLL loop control, and DCOCLK are disabled
  - DC generator of the DCO is disabled
  - Crystal oscillator is stopped
  - Complete data retention
- Low-power mode 3.5 (LPM3.5)
  - Internal regulator disabled
  - No RAM retention, Backup RAM retained
  - I/O pad state retention
  - RTC clocked by low-frequency oscillator
  - Wake-up input from  $\overline{\text{RST}}/\text{NMI}$ , RTC\_C events, Ports P1 and P2
- Low-power mode 4.5 (LPM4.5)
  - Internal regulator disabled
  - No RAM retention, Backup RAM retained
  - RTC is disabled
  - I/O pad state retention
  - Wake-up input from  $\overline{\text{RST}}/\text{NMI}$ , Ports P1 and P2

## 6.6 Interrupt Vector Addresses

The interrupt vectors and the power-up start address are in the address range 0FFFFh to 0FF80h (see [Table 6-3](#)). The vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence.

**Table 6-3. Interrupt Sources, Flags, and Vectors**

(1) Multiple source flags

(2) A reset is generated if the CPU tries to fetch instructions from within peripheral space or vacant memory space.

(3) (Non)maskable: the individual interrupt-enable bit can disable an interrupt event, but the general-interrupt enable cannot disable it.

(4) Interrupt flags are located in the module.

**Table 6-3. Interrupt Sources, Flags, and Vectors (continued)**

INTERRUPT SOURCE	INTERRUPT FLAG	SYSTEM INTERRUPT	WORD ADDRESS	PRIORITY

(5) Reserved interrupt vectors at addresses are not used in this device and can be used for regular program code if necessary. To maintain compatibility with other devices, TI recommends reserving these locations.

## 6.7 Bootloader (BSL)

The BSL lets users program the flash memory or RAM using various serial interfaces. [Table 6-4](#) lists the BSL interface pin requirements. Access to the device memory by the BSL is protected by a user-defined password. BSL entry requires a specific entry sequence on the  $\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$  and  $\text{TEST}/\text{SBWTCK}$  pins. For complete description of the features of the BSL and its implementation, see [MSP430 Programming With the Bootloader \(BSL\)](#).

**Table 6-4. UART BSL Pin Requirements and Functions**

DEVICE SIGNAL	BSL FUNCTION
$\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$	Entry sequence signal
$\text{TEST}/\text{SBWTCK}$	Entry sequence signal
P3.0	Data transmit
P3.1	Data receive
DVCC	Power supply
DVSS	Ground supply

## 6.8 JTAG Operation

### 6.8.1 JTAG Standard Interface

The MSP430 family supports the standard JTAG interface which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The  $\text{TEST}/\text{SBWTCK}$  pin is used to enable the JTAG signals. In addition to these signals, the  $\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$  is required to interface with MSP430 development tools and device programmers. [Table 6-5](#) lists the JTAG pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#) and [MSP430 Programming With the JTAG Interface](#).

**Table 6-5. JTAG Pin Requirements and Functions**

DEVICE SIGNAL	DIRECTION	FUNCTION
PJ.3/ACLK/TCK	IN	JTAG clock input

$\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$	IN	External reset
DVCC		Power supply
DVSS		Ground supply

## 6.8.2 Spy-Bi-Wire Interface

In addition to the standard JTAG interface, the MSP430 family supports the two-wire Spy-Bi-Wire interface. Spy-Bi-Wire can be used to interface with MSP430 development tools and device programmers. [Table 6-6](#) lists the Spy-Bi-Wire interface pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#) and [MSP430 Programming With the JTAG Interface](#).

## 6.9 Flash Memory

The flash memory can be programmed through the JTAG port, Spy-Bi-Wire (SBW), the BSL, or in-system by the CPU. The CPU can perform single-byte, single-word, and long-word writes to the flash memory. Features of the flash memory include:

- Flash memory has  $n$  segments of main memory and four segments of information memory (A to D) of 128 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to  $n$  may be erased in one step, or each segment may be individually erased.
- Segments A to D can be erased individually or as a group with segments 0 to  $n$ . Segments A to D are also called *information memory*.
- Segment A can be locked separately.

## 6.10 RAM

The RAM is made up of  $n$  sectors. Each sector can be completely powered down to save leakage; however, all data are lost. Features of the RAM include:

- RAM has  $n$  sectors of 2K bytes each.
- Each sector 0 to  $n$  can be complete disabled; however, data retention is lost.
- Each sector 0 to  $n$  automatically enters low-power retention mode when possible.

## 6.11 Backup RAM

The backup RAM provides a limited number of bytes of RAM that are retained during LPMx.5. This backup RAM is part of the Backup subsystem, which operates on dedicated power supply AUXVCC3. 8 bytes of backup RAM are available in this device. The backup RAM can be word-wise accessed through the registers BAKMEM0, BAKMEM1, BAKMEM2, and BAKMEM3. The backup RAM registers cannot be accessed by the CPU when the high-side SVS is disabled by software.

## 6.12 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. The peripherals can be managed using all instructions. For complete module descriptions, see the [MSP430x5xx and MSP430x6xx Family User's Guide](#).

### 6.12.1 Oscillator and System Clock

The unified clock system (UCS) module includes support for a 32768-Hz watch crystal oscillator, an internal very-low-power low-frequency oscillator (VLO), an internal trimmed low-frequency oscillator (REFO), and an integrated internal digitally controlled oscillator (DCO). The UCS module is designed to meet the requirements of both low system cost and low power consumption. The UCS module features digital frequency locked loop (FLL) hardware that, in conjunction with a digital modulator, stabilizes the DCO frequency to a programmable multiple of the selected FLL reference frequency. The internal DCO provides a fast turn-on clock source and stabilizes in 3  $\mu$ s (typical). The UCS module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32768-Hz watch crystal, the internal low-frequency oscillator (VLO), or the trimmed low-frequency oscillator (REFO).
- Main clock (MCLK), the system clock used by the CPU. MCLK can be sourced by same sources made available to ACLK.
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules. SMCLK can be sourced by same sources made available to ACLK.
- ACLK/n, the buffered output of ACLK, ACLK/2, ACLK/4, ACLK/8, ACLK/16, or ACLK/32

### 6.12.2 Power-Management Module (PMM)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device and contains programmable output levels to provide for power optimization. The PMM also includes supply voltage supervisor (SVS) and supply voltage monitoring (SVM) circuitry, and brownout protection. The brownout circuit provides the proper internal reset signal to the device during power on and power off. The SVS and SVM circuitry detects if the supply voltage drops below a user-selectable level and supports both supply voltage supervision (the device is automatically reset) and supply voltage monitoring (the device is not automatically reset). SVS and SVM are available on the primary supply and the core supply.

### 6.12.3 Auxiliary Supply System

The auxiliary supply system can operate the device from auxiliary supplies when the primary supply fails. There are two auxiliary supplies supported: AUXVCC1 and AUXVCC2. This module supports automatic and manual switching from primary supply to auxiliary supplies while maintaining full functionality. It allows threshold based monitoring of primary and auxiliary supplies. The device can be started from primary supply or AUXVCC1, whichever is higher. The auxiliary supply system enables internal monitoring of voltage levels on primary and auxiliary supplies using ADC10\_A. Also this module implements simple charger for backup supplies.

### 6.12.4 Backup Subsystem

The Backup subsystem operates on a dedicated power supply AUXVCC3. This subsystem includes low-frequency oscillator (XT1), RTC module, and backup RAM. The functionality of the Backup subsystem is retained during LPM3.5. The Backup subsystem module registers cannot be accessed by the CPU when the high-side SVS is disabled by user. It is necessary to keep the high-side SVS enabled with SVSHMD = 1 and SVSMHACE = 0 to turn off the low-frequency oscillator (XT1) in LPM4.

### 6.12.5 Digital I/O

Up to nine I/O ports are implemented. For 100-pin options, Ports P1 to P8 are complete. P9 is reduced to 4-bit I/O. For 80-pin options, Ports P1 to P6 are complete, and P7, P8, and P9 are completely removed. Port PJ contains four individual I/O pins, common to all devices. All I/O bits are individually programmable.

- Any combination of input, output, and interrupt conditions is possible.
- Pullup or pulldown on all ports is programmable.
- Programmable drive strength on all ports.
- Edge-selectable interrupt and LPM3.5 or LPM4.5 wake-up input capability available for all bits of ports P1 and P2.
- Read and write access to port-control registers is supported by all instructions.
- Ports can be accessed byte-wise (P1 through P9) or word-wise in pairs (PA through PE).

### 6.12.6 Port Mapping Controller

The port mapping controller allows flexible and reconfigurable mapping of digital functions to P1, P2, and P3 (see [Table 6-7](#)). [Table 6-8](#) lists the default settings for all pins that support port mapping.

### 6.12.7 System Module (SYS)

The SYS module handles many of the system functions within the device. These include power on reset (POR) and power up clear (PUC) handling, NMI source selection and management, reset interrupt vector generators (see [Table 6-9](#)), bootloader entry mechanisms, and configuration management (device descriptors). It also includes a data exchange mechanism through JTAG called a JTAG mailbox that can be used in the application.

### 6.12.8 Watchdog Timer (WDT\_A)

The primary function of the WDT\_A module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the timer can be configured as an interval timer and can generate interrupts at selected time intervals.

### 6.12.9 DMA Controller

The DMA controller allows movement of data from one memory address to another without CPU intervention. For example, the DMA controller can be used to move data from the ADC10\_A conversion memory to RAM. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode, without having to awaken to move data to or from a peripheral. [Table 6-10](#) lists the available DMA triggers.

### **6.12.10 CRC16**

The CRC16 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC16 module signature is based on the CRC-CCITT standard.

### **6.12.11 Hardware Multiplier**

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The module supports signed and unsigned multiplication as well as signed and unsigned multiply-and-accumulate operations.

### **6.12.12 Enhanced Universal Serial Communication Interface (eUSCI)**

The eUSCI module is used for serial data communication. The eUSCI module supports synchronous communication protocols such as SPI (3- or 4-pin) and I<sup>2</sup>C, and asynchronous communication protocols such as UART, enhanced UART with automatic baudrate detection, and IrDA.

The eUSCI\_An module supports for SPI (3- or 4-pin), UART, enhanced UART, or IrDA.

The eUSCI\_Bn module supports for SPI (3- or 4-pin) or I<sup>2</sup>C.

Three eUSCI\_A and one eUSCI\_B module are implemented.

### **6.12.13 ADC10\_A**

The ADC10\_A module supports fast 10-bit analog-to-digital conversions. The module implements a 10-bit SAR core, sample select control, reference generator, and a conversion results buffer. A window comparator with a lower and upper limit allows CPU independent result monitoring with three window comparator interrupt flags.

### **6.12.14 SD24\_B**

The SD24\_B module integrates up to three independent 24-bit sigma-delta ADCs. Each converter is designed with a fully differential analog input pair and programmable gain amplifier input stage. The converters are based on second-order over-sampling sigma-delta modulators and digital decimation filters. The decimation filters are comb-type filters with selectable oversampling ratios of up to 1024.

### 6.12.15 TA0

TA0 is a 16-bit timer/counter (Timer\_A type) with three capture/compare registers. TA0 can support multiple capture/compares, PWM outputs, and interval timing (see [Table 6-11](#)). TA0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

### 6.12.16 TA1

TA1 is a 16-bit timer/counter (Timer\_A type) with two capture/compare registers. TA1 can support multiple capture/compares, PWM outputs, and interval timing (see [Table 6-12](#)). TA1 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

### 6.12.17 TA2

TA2 is a 16-bit timer/counter (Timer\_A type) with two capture/compare registers. TA2 can support multiple capture/compares, PWM outputs, and interval timing (see [Table 6-13](#)). TA2 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

### 6.12.18 TA3

TA3 is a 16-bit timer/counter (Timer\_A type) with two capture/compare registers. TA3 can support multiple capture/compares, PWM outputs, and interval timing (see [Table 6-14](#)). TA3 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

SD24_B trigger pulse (internal)	ADC10_A ADC10SHSx = {3}	

### 6.12.21 Real-Time Clock (RTC\_C)

The RTC\_C module can be configured for real-time clock (RTC) or calendar mode providing seconds, hours, day of week, day of month, month, and year. The RTC\_C control and configuration registers are password-protected to ensure clock integrity against runaway code. Calendar mode integrates an internal calendar that compensates for months with less than 31 days and includes leap year correction. The RTC\_C also supports flexible alarm functions, offset calibration, and temperature compensation. The RTC\_C on this device operates on dedicated AUXVCC3 supply and supports operation in LPM3.5.

### 6.12.22 Reference (REF) Module Voltage Reference

The REF generates all of the critical reference voltages that can be used by the various analog peripherals in the device. These include the ADC10\_A, LCD\_C, and SD24\_B modules.

### 6.12.23 LCD\_C

The LCD\_C driver generates the segment and common signals required to drive a liquid crystal display (LCD). The LCD\_C controller has dedicated data memories to hold segment drive information. Common and segment signals are generated as defined by the mode. Static, 2-mux, 3-mux, 4-mux, up to 8-mux LCDs are supported. The module can provide an LCD voltage independent of the supply voltage with its integrated charge pump. It is possible to control the level of the LCD voltage, and thus contrast, by software. The module also provides an automatic blinking capability for individual segments in static, 2-mux, 3-mux, and 4-mux modes.

#### **6.12.24 Embedded Emulation Module (EEM) (S Version)**

The EEM supports real-time in-system debugging. The S version of the EEM has the following features:

- Three hardware triggers or breakpoints on memory access
- One hardware trigger or breakpoint on CPU register write access
- Up to four hardware triggers can be combined to form complex triggers or breakpoints
- One cycle counter
- Clock control on module level

## 6.16 Identification

### 6.16.1 Revision Identification

The device revision information is shown as part of the top-side marking on the device package. The device-specific errata sheet describes these markings. For links to all of the errata sheets for the devices in this data sheet, see [Section 8.4](#).

The hardware revision is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the "Hardware Revision" entries in [Section 6.14](#).

### 6.16.2 Device Identification

The device type can be identified from the top-side marking on the device package. The device-specific errata sheet describes these markings. For links to all of the errata sheets for the devices in this data sheet, see [Section 8.4](#).

A device identification value is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the "Device ID" entries in [Section 6.14](#).

### 6.16.3 JTAG Identification

Programming through the JTAG interface, including reading and identifying the JTAG ID, is described in detail in [MSP430 Programming With the JTAG Interface](#).

## 7 Applications, Implementation, and Layout

---

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

---

The following resources provide application guidelines and best practices when designing with the MSP430F67641A and MSP430F67621A devices.

#### ***Implementation of a Low-Cost Three-Phase Watt-Hour Meter Using the MSP430F67641(A) (SLAA621)***

This application report describes the implementation of a low-cost three-phase electronic electricity meter using the Texas Instruments MSP430F67641(A) metering processor. This application report includes the necessary information with regard to metrology software and hardware procedures for this single-chip implementation.

#### ***Class 0.5 Three-Phase Smart Meter Reference Design (TIDM-THREEPHASEMETER-F67641)***

This design implements a complete smart meter design using the MSP430F67641(A) polyphase metering System on Chip. The design meets all requirements for ANSI/IEC Class 0.5 accuracy and the firmware provided calculates all energy measurement parameters. The F67641(A) SoC features 128KB of on-chip flash plus a 320-segment LCD controller for a single-chip solution to low-cost polyphase meter design challenges.

#### **Features**

- Low-cost three-phase electricity meter for Class 0.5 accuracy
- TI Energy Library firmware calculates all energy measurement parameters including active and reactive power and energy, RMS current and voltage, power factor, line frequency, fundamental and THD readings
- Add-on communications modules for wireless communications standards such as ZigBee®, Wi-Fi®, Wireless M-Bus, and IEEE Std 802.15.4g for both 2.4 GHz and sub-1 GHz.
- Built-in 160-segment display
- Powered from three-phase line voltage

## 8 Device and Documentation Support

### 8.1 Getting Started and Next Steps

For more information on the MSP430™ family of devices and the tools and libraries that are available to help with your development, visit the [Getting Started](#) page.

### 8.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

**XMS** – Experimental device that is not necessarily representative of the final device's electrical specifications

**MSP** – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. [Figure 8-1](#) provides a legend for reading the complete device name.

### 8.3 Tools and Software

All MSP microcontrollers are supported by a wide variety of software and hardware development tools. Tools are available from TI and various third parties. See them all at [MSP430 Ultra-Low-Power MCUs – Tools & software](#).

Table 8-1 lists the debug features of the MSP430F676x1A MCUs. See the [Code Composer Studio for MSP430 User's Guide](#) for details on the available features.

#### Design Kits and Evaluation Modules

**EVM430-F6779 - 3-Phase Electronic Watt-Hour EVM for Metering** This EVM430-F6779 is a three-phase electricity meter evaluation module based on the MSP430F6779 device. The E-meter has inputs for three voltages and three currents, as well as an additional connection to set up antitampering.

**Polyphase Electric Meter with MSP430F67641 SoC** This EVM implements a complete smart meter design using the MSP430F67641 polyphase metering System on Chip. The design meets all requirements for ANSI/IEC Class 0.5 accuracy. The F67641 SoC features 128KB of on-chip flash plus a 320-segment LCD controller for a single-chip solution to low-cost polyphase meter design challenges.

#### Software

**MSP430Ware™ Software** MSP430Ware software is a collection of code examples, data sheets, and other design resources for all MSP430 devices delivered in a convenient package. In addition to providing a complete collection of existing MSP430 MCU design resources, MSP430Ware software also includes a high-level API called MSP Driver Library. This library makes it easy to program MSP430 hardware. MSP430Ware software is available as a component of CCS or as a stand-alone package.

**DLMS (Device Language Message Specification) for MSP430 E-meter SoCs** The TI DLMS/COSEM library supports the MSP430 MCU product line. DLMS has been adopted by the IEC TC13 WG14 into the IEC 62056 series of standards.

**IEC60730 Software Package** The IEC60730 MSP430 software package was developed to help customers comply with IEC 60730-1:2010 (Automatic Electrical Controls for Household and Similar Use – Part 1: General Requirements) for up to Class B products, which includes home appliances, arc detectors, power converters, power tools, e-bikes, and many others. The IEC60730 MSP430 software package can be embedded in customer applications running on MSP430s to help simplify the customer's certification efforts of functional safety-compliant consumer devices to IEC 60730-1:2010 Class B.

**MSP Driver Library** The abstracted API of MSP Driver Library provides easy-to-use function calls that free you from directly manipulating the bits and bytes of the MSP430 hardware. Thorough documentation is delivered through a helpful API Guide, which includes details on each function call and the recognized parameters. Developers can use Driver Library functions to write complete projects with minimal overhead.

**MSP430F67641, MSP430F67621 Code Examples** C Code examples are available for every MSP device that configures each of the integrated peripherals for various application needs.

**Capacitive Touch Software Library** Free C libraries for enabling capacitive touch capabilities on MSP430 MCUs. The MSP430 MCU version of the library features several capacitive touch implementations including the RO and RC method.

**MSP EnergyTrace™ Technology** EnergyTrace technology for MSP430 microcontrollers is an energy-based code analysis tool that measures and displays the energy profile of the application and helps to optimize it for ultra-low-power consumption.

**ULP (Ultra-Low Power) Advisor** ULP Advisor™ software is a tool for guiding developers to write more efficient code to fully use the unique ultra-low-power features of MSP and MSP432 microcontrollers. Aimed at both experienced and new microcontroller developers, ULP Advisor checks your code against a thorough ULP checklist to help minimize the energy consumption of your application. At build time, ULP Advisor provides notifications and remarks to highlight areas of your code that can be further optimized for lower power.

**Fixed Point Math Library for MSP** The MSP IQmath and Qmath Libraries are a collection of highly optimized and high-precision mathematical functions for C programmers to seamlessly port a floating-point algorithm into fixed-point code on MSP430 and MSP432 devices. These routines are typically used in computationally intensive real-time applications where optimal execution speed, high accuracy, and ultra-low energy are critical. By using the IQmath and Qmath libraries, it is possible to achieve execution speeds considerably faster and energy consumption considerably lower than equivalent code written using floating-point math.

**Floating Point Math Library for MSP430** Continuing to innovate in the low-power and low-cost microcontroller space, TI provides MSPMATHLIB. Leveraging the intelligent peripherals of our devices, this floating-point math library of scalar functions that are up to 26 times faster than the standard MSP430 math functions. Mathlib is easy to integrate into your designs. This library is free and is integrated in both Code Composer Studio IDE and IAR Embedded Workbench IDE.

## Development Tools

**Code Composer Studio™ Integrated Development Environment for MSP Microcontrollers** Code Composer Studio (CCS) integrated development environment (IDE) supports all MSP microcontroller devices. CCS comprises a suite of embedded software utilities used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features.

**Command-Line Programmer** MSP Flasher is an open-source shell-based interface for programming MSP microcontrollers through a FET programmer or eZ430 using JTAG or Spy-Bi-Wire (SBW) communication. MSP Flasher can download binary files (.txt or .hex) directly to the MSP microcontroller without an IDE.

**MSP MCU Programmer and Debugger** The MSP-FET is a powerful emulation development tool – often called a debug probe – which lets users quickly begin application development on MSP low-power MCUs. Creating MCU software usually requires downloading the resulting binary program to the MSP device for validation and debugging.

**MSP-GANG Production Programmer** The MSP Gang Programmer is an MSP430 or MSP432 device programmer that can program up to eight identical MSP430 or MSP432 flash or FRAM devices at the same time. The MSP Gang Programmer connects to a host PC using a standard RS-232 or USB connection and provides flexible programming options that let the user fully customize the process.

## 8.4 Documentation Support

The following documents describe the MSP430F676x1A MCUs. Copies of these documents are available on the Internet at [www.ti.com](http://www.ti.com).

### Receiving Notification of Document Updates

To receive notification of documentation updates—including silicon errata—go to the product folder for your device on [ti.com](http://ti.com) (see [Section 8.5](#) for links). In the upper right corner, click the "Alert me" button. This registers you to receive a weekly digest of product information that has changed (if any). For change details, check the revision history of any revised document.

### Errata

**MSP430F67641A Device Erratasheet** Describes the known exceptions to the functional specifications.

**MSP430F67621A Device Erratasheet** Describes the known exceptions to the functional specifications.

## User's Guides

**MSP430x5xx and MSP430x6xx Family User's Guide** Detailed information on the modules and peripherals available in this device family.

**MSP430™ Flash Device Bootloader (BSL) User's Guide** The MSP430 bootloader (BSL) lets users communicate with embedded memory in the MSP430 microcontroller during the prototyping phase, final production, and in service. Both the programmable memory (flash memory) and the data memory (RAM) can be modified as required. Do not confuse the bootloader with the bootstrap loader programs found in some digital signal processors (DSPs) that automatically load program code (and data) from external memory to the internal memory of the DSP.

**MSP430 Programming With the JTAG Interface** This document describes the functions that are required to erase, program, and verify the memory module of the MSP430 flash-based and FRAM-based microcontroller families using the JTAG communication port. In addition, it describes how to program the JTAG access security fuse that is available on all MSP430 devices. This document describes device access using both the standard 4-wire JTAG interface and the 2-wire JTAG interface, which is also referred to as Spy-Bi-Wire (SBW).

**MSP430 Hardware Tools User's Guide** This manual describes the hardware of the TI MSP-FET430 Flash Emulation Tool (FET). The FET is the program development tool for the MSP430 ultra-low-power microcontroller. Both available interface types, the parallel port interface and the USB interface, are described.

## Application Reports

**Implementation of a Single-Phase Electronic Watt-Hour Meter Using MSP430F6736(A)** This application report describes the implementation of a single-phase electronic electricity meter using the Texas Instruments MSP430F673x(A) metering processor. It also includes the necessary information with regard to metrology software and hardware procedures for this single-chip implementation.

**Differences Between MSP430F67xx and MSP430F67xxA Devices** This application report describes the enhancements of the MSP430F67xxA devices from the non-A MSP430F67xx devices. This application report describes the MSP430F67xx errata that are fixed in the MSP430F67xxA and the additional features added to the MSP430F67xxA devices. In addition, metrology results are compared to further show that the changes implemented in the MSP430F67xxA devices do not affect the metrology performance.

**MSP430 32-kHz Crystal Oscillators** Selection of the correct crystal, correct load circuit, and proper board layout are important for a stable crystal oscillator. This application report summarizes crystal oscillator function and explains the parameters to select the correct crystal for MSP430 ultra-low-power operation. In addition, hints and examples for correct board layout are given. The document also contains detailed information on the possible oscillator tests to ensure stable oscillator operation in mass production.

**MSP430 System-Level ESD Considerations** System-Level ESD has become increasingly demanding with silicon technology scaling towards lower voltages and the need for designing cost-effective and ultra-low-power components. This application report addresses three different ESD topics to help board designers and OEMs understand and design robust system-level designs.

**Designing With MSP430 and Segment LCDs** Segment liquid crystal displays (LCDs) are needed to provide information to users in a wide variety of applications from smart meters to electronic shelf labels (ESLs) to medical equipment. Several MSP430™ microcontroller families include built-in low-power LCD driver circuitry that allows the MSP430 MCU to directly control the segmented LCD glass. This application note helps explain how segmented LCDs work, the different features of the various LCD modules across the MSP430 MCU family, LCD hardware layout tips, guidance on writing efficient and easy-to-use LCD driver software, and an overview of the portfolio of MSP430 devices that include different LCD features to aid in device selection.

## 8.8 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 8.9 Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
