definition of logic levels

INPUT	H	L	X
A or B _t	$V_{ID} \geq V_T \text{ max}$	$V_{ID} \leq V_T \text{ min}$	Irrelevant
Any G or S	$V_I \geq V_{IH} \text{ min}$	$V_I \leq V_{IL} \text{ max}$	Irrelevant

[†]A and B are differential voltages (V_{ID}) between A1 and A2 or B1 and B2, respectively. For these circuits, V_{ID} is considered positive regardless of which terminal of each pair is positive with respect to the other.

NOTES: 3. The differential-input threshold voltage (V_T) is defined as the d-c differential-input voltage (V_{ID}) required to force the output of the sense amplifier to the logic gate threshold voltage level.

4. Common-mode input firing voltage is the minimum common-mode voltage that will exceed the dynamic range of the input at the specified conditions and cause the logic output to switch. The specified common-mode input signal is applied with a strobe-enable pulse present.
