description

The LT1028 features excellent noise performance combined with high-speed specifications, distortion-free output, and true precision parameters. Although the LT1028 input stage operates at collector currents of nearly 1 mA to achieve low voltage noise, the input bias current is only 25 or 30 nA at 25°C. The noise voltage of the LT1028 is less than the noise of a 50- Ω resistor. Therefore, even in very-low-source-impedance transducer or audio amplifier applications, the device's contribution to total system noise will be negligible.

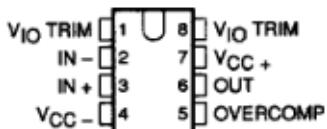

The LT1028AM and LT1028M are characterized for operation over the full military temperature range of -55°C to 125°C . The LT1028AC and LT1028C are characterized for operation from 0°C to 70°C.
