- Wide Range of Supply Voltages
$1.4-\mathrm{V}$ to $16-\mathrm{V}$
- True Single-Supply Operation
- Common-Mode Input Voltage Range Includes the Negative Rail
- Low Noise ... $30 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ Typ at $1-\mathrm{kHz}$ (High Bias)
- ESD Protection Exceeds 2000 V Per MIL-STD-833C, Method 3015.1

## description

The TLC251C, TLC251AC, and TLC251BC are low-cost, low-power programmable operational amplifiers designed to operate with single or dual supplies. Unlike traditional metal-gate CMOS operational amplifiers, these devices utilize Texas Instruments silicon-gate LinCMOS ${ }^{\text {TM }}$ process, giving them stable input offset voltages without sacrificing the advantages of metal-gate CMOS. This series of parts is available in selected grades of input offset voltage and can be nulled with one external potentiometer. Because the input common-mode range extends to the negative rail and the power consumption is extremely low, this family is ideally suited for battery-powered or energy-conserving applications. A bias-select pin can be used to program one of three ac performance and power-dissipation levels to suit the application. The series features operation down to a $1.4-\mathrm{V}$ supply and is stable at unity gain.
These devices have internal electrostatic-discharge (ESD) protection circuits that prevent catastrophic failures at voltages up to 2000 V as tested under MIL-STD-883C, Method 3015.1. However, care should be exercised in handling these devices as exposure to ESD may result in a degradation of the device parametric performance.

Because of the extremely high input impedance and low input bias and offset currents, applications for the TLC251C series include many areas that have previously been limited to BIFET and NFET product types. Any circuit using high-impedance elements and requiring small offset errors is a good candidate for cost-effective use of these devices. Many features associated with bipolar technology are available with LinCMOS ${ }^{\text {TM }}$ operational amplifiers without the power penalties of traditional bipolar devices. Remote and inaccessible equipment applications are possible using the low-voltage and low-power capabilities of the TLC251C series.
In addition, by driving the bias-select input with a logic signal from a microprocessor, these operational amplifiers can have software-controlled performance and power consumption. The TLC251C series is well suited to solve the difficult problems associated with single battery and solar cell-powered applications.

The TLC251C series is characterized for operation from $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$.

## schematic

## TLC251Y chip information

These chips, properly assembled, display characteristics similar to the TLC251C. Thermal compression or ultrasonic bonding may be used on the doped-aluminum bonding pads. Chips may be mounted with conductive epoxy or a gold-silicon preform.

These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. NOTES: 1. All voltage values, except differential voltages, are with respect to VDD_/GND. 2. Differential voltages are at $I N+$ with respect to $I N-$. 3. The output may be shorted to either supply. Temperature and/or supply voltages must be limited to ensure the maximum dissipation rating is not exceeded

## APPLICATION INFORMATION

## latch-up avoidance

Junction-isolated CMOS circuits have an inherent parasitic PNPN structure that can function as an SCR. Under certain conditions, this SCR may be triggered into a low-impedance state, resulting in excessive supply current. To avoid such conditions, no voltage greater than 0.3 V beyond the supply rails should be applied to any pin. In general, the operational amplifier supplies should be applied simultaneously with, or before, application of any input signals.

## APPLICATION INFORMATION

## using BIAS SELECT

The TLC251 has a terminal called BIAS SELECT that allows the selection of one of three $\mathrm{I}_{\text {DD }}$ conditions ( 10 , 150 , and $1000 \mu \mathrm{~A}$ typical). This allows the user to trade-off power and ac performance. As shown in the typical supply current ( $\mathrm{I}_{\mathrm{DD}}$ ) versus supply voltage ( $\mathrm{V}_{\mathrm{DD}}$ ) curves (Figure 4), the $\mathrm{I}_{\mathrm{DD}}$ varies only slightly from 4 V to 16 V . Below 4 V , the $\mathrm{I}_{\mathrm{DD}}$ varies more significantly. Note that the $\mathrm{I}_{\mathrm{DD}}$ values in the medium- and low-bias modes at $\mathrm{V}_{\mathrm{DD}}=1.4 \mathrm{~V}$ are typically $2 \mu \mathrm{~A}$, and in the high mode are typically $12 \mu \mathrm{~A}$. The following table shows the recommended BIAS SELECT connections at $\mathrm{V}_{\mathrm{DD}}=10 \mathrm{~V}$.

| BIAS MODE | AC PERFORMANCE | BIAS SELECT <br> CONNECTION $\dagger$ | TYPICAL IDD ${ }^{\ddagger}$ |
| :---: | :---: | :---: | :---: |
| Low | Low | VDD | $10 \mu \mathrm{~A}$ |
| Medium <br> High | Medium | 0.8 V to 9.2 V | $150 \mu \mathrm{~A}$ |
| High | Ground pin | $1000 \mu \mathrm{~A}$ |  |

$\dagger$ Bias selection may also be controlled by external circuitry to conserve power, etc. For information regarding BIAS SELECT, see Figure 3 in the typical characteristics curves.
$\ddagger$ For IDD characteristics at voltages other than 10 V , see Figure 4 in the typical characteristics curves.

## output stage considerations

The amplifier's output stage consists of a source-follower-connected pullup transistor and an open-drain pulldown transistor. The high-level output voltage $\left(\mathrm{V}_{\mathrm{OH}}\right)$ is virtually independent of the $\mathrm{I}_{\mathrm{DD}}$ selection and increases with higher values of $\mathrm{V}_{\mathrm{DD}}$ and reduced output loading. The low-level output voltage $\left(\mathrm{V}_{\mathrm{OL}}\right)$ decreases with reduced output current and higher input common-mode voltage. With no load, $\mathrm{V}_{\mathrm{OL}}$ is essentially equal to the potential of $\mathrm{V}_{\mathrm{DD}} / \mathrm{GND}$.

## input offset nulling

The TLC251C series offers external offset null control. Nulling may be achieved by adjusting a $25-\mathrm{k} \Omega$ potentiometer connected between the offset null terminals with the wiper connected to the device $\mathrm{V}_{\mathrm{DD}}$ _/GND pin as shown in Figure 2. The amount of nulling range varies with the bias selection. At an I DD setting of $1000 \mu \mathrm{~A}$ (high bias), the nulling range allows the maximum offset specified to be trimmed to zero. In low or medium bias or when the amplifier is used below 4 V , total nulling may not be possible for all units.

## supply configurations

Even though the TLC251C series is characterized for single-supply operation, it can be used effectively in a split-supply configuration when the input common-mode voltage ( $\mathrm{V}_{\mathrm{ICR}}$ ), output swing ( $\mathrm{V}_{\mathrm{OL}}$ and $\mathrm{V}_{\mathrm{OH}}$ ), and supply voltage limits are not exceeded.

## circuit layout precautions

The user is cautioned that whenever extremely high circuit impedances are used, care must be exercised in layout, construction, board cleanliness, and supply filtering to avoid hum and noise pickup, as well as excessive dc leakages.

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but Tl does not recommend using this part in a new design
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
